Robin is a young college student who recently opened his very first bank account. To keep track of his money, Robin decided to create a small banking system using Python. This program allows him to check his balance, deposit money, and withdraw money whenever needed. The system is interactive, menu-based, and simulates a real-world banking experience where users can manage their funds step by step.

By developing this project, Robin not only manages his savings but also sharpens his Python skills by using variables, conditional statements, user input, and arithmetic operations.

list = sum() → check his balance.

deposit = append ✓ / Enter.
